

CARE Clinic

Cranial Asymmetry Repositioning Evaluation (CARE)

For infants with plagiocephaly and torticollis, we offer an enhancement to our free helmet evaluations, with the addition of a physical therapist to address further needs, all in one appointment.

Infant Plagiocephaly and Torticollis Diagnoses

These diagnoses are on the rise and often occur together. LifeScape has responded to this higher need with the CARE (Cranial Asymmetry Repositioning Evaluation) Clinic, to screen for and treat both conditions. The clinic's team of physical therapists and orthotists, with onsite physician availability, aim to provide comprehensive CARE for this complex diagnosis.

Early Detection

For both torticollis and plagiocephaly, early detection is critical for effective treatment and parent education. Screenings for both conditions are available at LifeScape to determine if a full evaluation is advised. Torticollis and/or plagiocephaly can also affect a child's development, facial alignment, and even vision. Early detection allows for appropriate treatment and parent education.

The Most Advanced Technology – to Deliver the Best Results

LifeScape is the only facility in the state using the STARscanner laser data acquisition system, using Type 1, eye-safe lasers, which takes less than two seconds to scan. It is the most accurate means of collecting 3-D head shape data for custom orthoses. The scanner compares scans throughout the treatment process to document and measure changes in shape.

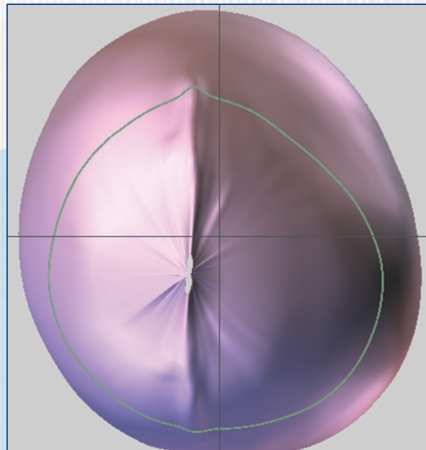

The CARE Clinic provides a team approach for the treatment of plagiocephaly and torticollis.
